Part two Question 1

Key Differences between my class code and the AI-generated function code

Aspect	Function	Class
State	Stateless - data passed each time	Stateful - data stored in an object
Usage	sort_dictionaries(data, 'key')	sorter.by_key('key')
Error Handling	Built-in try/except	None (will crash on errors)
Additional Features	Just sorting	Can add show_keys(), by_multiple_keys()
Data Access	No access to original data	Can inspect data via methods
Performance	Good for one-off sorting	Better for multiple operations on the same data
